

Converting .dav files to .avi

Introduction: The default file format the DVR records to is .dav. While there is a player to play these files some might prefer to convert them to a more common format such as avi. The avi file format will play in most media players such as Windows Media Player, Media Player Classic, VLC, etc. This tutorial will take you through the steps to convert your videos into the avi file format through the DAV player.

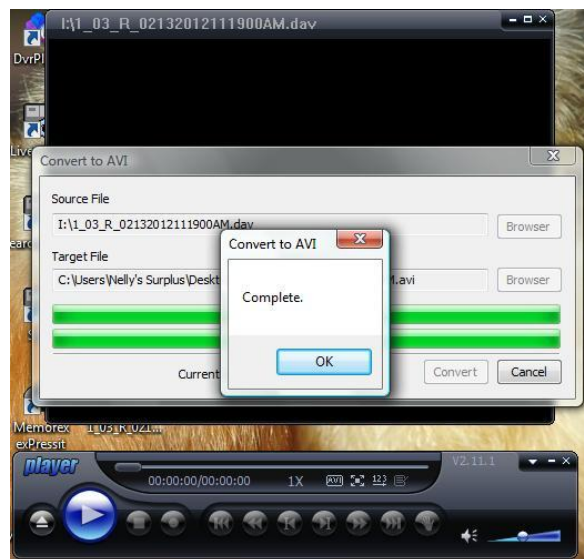

Step 1: First lets locate a recorded video file and **open it by double clicking it**. Once the video player is open and you are viewing your video there will be a button located under the timeline bar on the right side that says **AVI**. *If you hover your mouse cursor over it a message will pop up that says convert to avi.*

Step 2: Click the **AVI** button to bring up another window asking where you would like your converted file saved to. Browse to a directory you want to save to. *In our example we chose desktop to save to.*

Step 3: Next, click the **OK** button to confirm your save directory, then click the **Convert** button to begin conversion to AVI file format. Once complete you will be presented with a message confirming it was completed successfully.

Step 5: Locate the file and **double click** to view your newly converted file.
